

LESSON - 13

CSS z-index & overflow

CSS me z-index aur overflow dono important properties hain.

z-index -

z-index kisi element ka layering order set karta hai – kaunsa element upar dikhega aur kaunsa neeche. Ye tabhi kaam karega jab element ki position relative, absolute, fixed ya sticky ho.

overflow -

Overflow element visibility ko control karte hain. Overflow decide karta hai ki jab content element ke andar fit nahi hota, toh uska kya karna chahiye.

- **visible (default)** - Extra content dikhega
- **hidden** – Extra content chhup jayega
- **scroll** – Hamesha scroll bar aayega
- **auto** – Scroll bar sirf tabhi aayega jab zarurat ho
