

LESSON - 22

CSS Animation

CSS Animation ek aisa feature hai jisse hum apne HTML elements ko move, rotate, scale, fade in/out ya aur bhi visual effects de sakte hain bina JavaScript use kiye.

CSS Animation ke Do Parts -

1. **@keyframes** – Ye batata hai ki animation me kis step par element ka style kaisa hoga.
2. **animation property** – Ye batata hai ki animation ko kaise chalana hai (duration, delay, repeat, speed etc.).

eg. -

```
1. @keyframes animation-name {  
    from { css properties }  
    to { css properties }  
}
```

```
2. @keyframes animation-name {  
    0% { css properties }  
    100% { css properties }  
}
```

Animation Properties -

- **animation-name** – animation ka name aayega.
- **animation-duration** – kitni der chalega (e.g. 2s).
- **animation-timing-function** – speed me smoothness lane ke liye (linear, ease, ease-in, ease-out, ease-in-out, steps & cubic-bezier).
- **animation-delay** – start hone se pehle kitna time wait kare.
- **animation-iteration-count** – kitni baar chale (1, 2, infinite).
- **animation-direction** – normal, reverse, alternate and alternate-reverse.
- **animation-fill-mode** – end hone ke baad ka style kya rahe (none, forwards, backwards, both).
