

LESSON - 01

Types of JavaScript

Sort type and intro Javascript

- **Vanilla JS** = Base
- **Client-side** = Browser
- **Server-side** = Backend
- **ES versions** = Updated rules/features
- **Libraries & Frameworks** = Add-ons for speed & structure

1. Core JavaScript (Vanilla JS)

- Ye JavaScript ka original / pure form hai.
- Koi library ya framework use nahi hota.

Example: Button click pe alert dikhana, form validation, DOM manipulation.

2. Client-side JavaScript

- Ye code browser ke andar run hota hai.
- User ke interaction handle karta hai:
 - Clicks
 - Animations
 - Form inputs

Example: Google search suggestions, dropdowns, sliders.

3. Server-side JavaScript

- Ye server pe run hota hai (browser pe nahi).
- Backend ke liye use hota hai.

Example: Node.js → data handle karna, APIs banana, database se baat karna.

4. ES Versions (ECMAScript)

JavaScript ke alag-alag versions hote hain jinko ES5, ES6, ES7... bolte hain.

- **ES5 (2009)** → var, functions, objects basics.
- **ES6 (2015)** → let/const, arrow functions, classes, promises.
- Baad me naye features aate rahe like async/await, optional chaining, etc.

5. Libraries aur Frameworks (JS ke flavours)

- **Libraries** → Pre-written code jo aap use kar sakte ho.
(Example: jQuery)
- **Frameworks** → Full structure banate hain app banane ke liye.
 - **Frontend**: React.js, Angular, Vue.js
 - **Backend**: Node.js, Express.js
